1 Scope

This Interface Configuration Document (ICD) specifies the communication protocol between the Code Reader 2.0™ (CR2), Code Reader 3.0™ (CR3), Code Reader 2500™ (CR2500), Code Reader 3500™ (CR3500), Code Reader 1200™ (CR1200) and application software that runs on the Host computer, specific Reader commands, examples of a variety of ways to communicate and send data to the Reader (i.e., RS232, USB, RF) and command/communication types.

It is important to note that some functionality has changed and/or been added for each firmware release. Make sure to use the latest released firmware for both boot and app.

CR2/CR3/CR2500/CR3500 default values listed in Section 8 were compiled using firmware version 4634. CR1200 default values listed in Section 8 were compiled using firmware version 4226.

2 Host to Reader Command Overview

This section is intended to introduce developers/users to the basic command types of the Reader. There are two ways to send a command to the Reader; from a Host computer, or by scanning a bar code containing a command sequence. In addition, there are two methods of sending a command from a Host computer to the Reader; packetized and text commands.

2.1 Packetized Commands

Packetized commands are the most reliable way to communicate to the Reader. The packet consists of a prefix and a suffix. The prefix contains the amount of data to be transmitted and the suffix contains error detection. Unlike text commands, packetized commands are always enabled. (See Section 6.2)

2.2 Text Commands

Text commands are provided as an easy way to send a command to a Reader but they lack the reliability of packetized commands. In addition, text commands must be enabled. Text commands can easily be sent from a terminal program and uses a %xx (similar to URL encoding) to translate an escape sequence containing a 2-digit hex value to the corresponding single 8-bit ASCII character. This allows non-printable ASCII characters to be entered via the terminal program. Text commands can be sent via the RS232, USB Virtual COM or RF mode by using appropriate communication software. In addition, the developer/user may send text commands by using CRB files. (See Section 10)

2.3 Bar Code Commands

The Reader will recognize the following sequence within a bar code as a command to the Reader:

SOH ‘X’ GS STX *Text-Command* EOT (Packet does not contain spaces)

The *Text-Command* portion contains a text command as described above.

Because the Bar Code Command is terminated with ASCII EOT, the *Text-Command* may not contain EOT. If the *Text-Command* needs to contain EOT, encode it as %04.

2.4 Training

Code Corporation highly recommends attending technical training provided by Code via Webinar and on site. This training is designed to provide in-depth knowledge/usage of the ICD for developers and users.

3 Definitions

3.1 Notations

The interface protocol is described as a set of grammars, indicated by different type styles and symbols. These indications are listed in the table below.

Example	Indication	Grammar
<i>Text-Command</i>	Italic type	Syntactic categories (non-terminals)
space	Bold type	Terminal symbols
0xFF	0x prefix indicating hexadecimal	Literal byte values
'X'	Single quotes	Literal ASCII characters
SOH	All caps	Non-printable ASCII characters
PageUp	Key name	key press-release sequence
shift↓	Key plus down arrow	Key-down only
shift↑	Key plus up arrow	Key-up only
esc tab	Vertical bar	Alternatives (this or that)
<i>data_{opt}</i>	opt. (Opt subscript)	Optional terminals and non-terminals
<i>packet-type_{nz}</i>	nz (Nz subscript)	Applies to all packets except z type packets
<i>crc16_{nr}</i>	nr (Nr subscript)	Applies to packets sent in "non-raw" mode, i.e., in "packet" mode

4 Communication Medium

The Reader communicates with the Host via USB, keyboard wedge (PS/2 or AT), RS232, PC-Card, or Bluetooth® Serial Port Profile. The Host includes appropriate hooks and/or drivers to enable two-way communication with the Reader.

5 Reader to Host Communication

The Reader may be configured in raw mode, where no packet framing or check characters are sent, and packet mode. (See section 2.1 and 2.2) The Reader may also be configured to expect an acknowledgement from the Host after each packet and automatic retry when no acknowledgement is received. Standard “one-way” mode of operation uses raw packets, no expected response from Host, and no automatic retry. Standard “two-way” mode of operation uses packets with framing and checks characters, expects a response from the Host, and automatically resends. If no Acknowledgement is received (Ack), three (3) attempts to resend are made.

5.1 Raw Data

Reader to Host communication consists of decoded raw data having no framing or check characters. Raw data is sent with no “end of packet” data (crc16). One-way communication, expects no response from Host and no data is resent.

5.2 Packet Data

Data from the Reader to the Host consist of *packets* as specified below. Packetized data is sent using ACK/NAC protocols with framing and check characters. Packets are delivered asynchronously as graphical codes are read and in response to Host to Reader commands. For keyboard communication (USB keyboard or PS/2 or AT keyboard), all *ascii-characters* are transmitted as *keyboard-sequences*. For all other communication ports, all *ascii-characters* are transmitted as *ascii-bytes*.

Note: when sending data via the keyboard port, the state of the Caps-Lock is assumed to be “off” (i.e., capital letters are always shifted; lower-case letters are never shifted). The Host shall perform capitalization-translation, if necessary, based on the actual state of the Caps-Lock.

Note: Even though the data size field allows up to 65535 bytes of data in a packet, the actual size of a packet either in raw or in packet mode including data and packet overhead is maximum 16384 bytes.

<i>packet:</i>	<i>start packet-type_{nz} data_{opt} end</i>
<i>start:</i>	<i>packet-start_{nr} codeXML-start_{nz}</i>
<i>packet-start:</i>	SOH ‘X’ ‘R’ <i>protocol-version Reader-id packet-number timestamp data-size</i>
<i>end:</i>	<i>codeXML-end_{nz} crc16_{nr}</i>
<i>codeXML-start:</i>	SOH ‘X’ RS <i>tag_response ‘/’</i>
<i>codeXML-end:</i>	EOT
<i>tag_response:</i>	‘ap’
<i>packet-type:</i>	Single <i>ascii-character</i> in table below
<i>data:</i>	<i>character</i>
	<i>/ data character</i>
<i>protocol-version:</i>	‘1’
<i>Reader-id:</i>	big-endian 32-bit number
<i>packet-number:</i>	<i>data-packet-number cmd-packet-number</i>
<i>data-packet-number:</i>	any byte value in the range [0,7f]; increments with each packet; does not increment with resends; used with <i>z</i> and <i>a</i> packets only

code

cmd-packet-number: any byte value in the range [80-ff]; increments with each packet; does not increment with resends; used with all packets other than *z* and *a*

timestamp (4 bytes): big-endian 32-bit number, indicates timestamp in seconds (relative to Reader power-up or last time set in Reader) (For all but *z* packets, the timestamp represents the time the packet was sent to the Host; for *z* packets, the time the code was read.)

timestamp (3 bytes): three characters in range [0,127], most significant character first, indicates 21-bit timestamp in seconds (relative to Reader power-up or last time set in Reader) (for all but *z* packets, the timestamp represents the time the packet was sent to the Host; for *z* packets, the time the code was read)

data-size: big-endian 16-bit number indicating size of the *data* field (in bytes)

character:
 byte
 / *keyboard-sequence*

byte: any byte value in range [0x00,0xFF]

keyboard-sequence: *key*
 / **shift**↓ *key* **shift**↑
 / **alt**↓ *decimal-code* **alt**↑

key: ~ | **1** | **2** | **3** | **4** | **5** | **6** | **7** | **8** | **9** | **0** | **-** | **=**
 | **q** | **w** | **e** | **r** | **t** | **y** | **u** | **i** | **o** | **p** | **[** | **]** | ****
 | **a** | **s** | **d** | **f** | **g** | **h** | **j** | **k** | **l** | **;** | **'**
 | **z** | **x** | **c** | **v** | **b** | **n** | **m** | **,** | **.** | **/**
 | **space**

 | **f1** | **f2** | **f3** | **f4** | **f5** | **f6** | **f7** | **f8** | **f9** | **f10** | **f11** | **f12**
 | **insert** | **delete** | **home** | **end** | **pageup** | **pagedown**
 | **left** | **right** | **up** | **down** | **keypadenter**
 | *digit*

decimal-code: *digit* / *digit digit* / *digit digit digit* (range [0,255])

digit: **keypad0** | **keypad1** | **keypad2** | **keypad3** | **keypad4**
 | **keypad5** | **keypad6** | **keypad7** | **keypad8** | **keypad9**

crc16: *big-endian 16-bit number* representing *crc16* of the packet, calculated over the entire packet, excluding the *crc16* itself. (See source files *crc16.[hc]* (Appendix) for details on the *crc16* algorithm and polynomials to be used.)

crc14: two consecutive bytes, each in range [0,127], representing a *crc16* bitwise AND with 0x7f7f, most significant byte first. The packet *crc16* is calculated over the entire packet, excluding the *prefix* and the *crc14* itself. (See source files *crc16.[hc]* (Appendix) for details on the *crc16* algorithm and polynomials to be used.)

The following *packet-types* are defined:

code

a	Indicates that <i>data</i> contains the first part of a decode. A sequence of <i>a</i> packets always ends with a <i>z</i> packet. The data of all <i>a</i> packets in a group and the final <i>z</i> packet are concatenated by the Host. (Also see the Host-to-Reader ‘R’ command description.)
d	Indicates that a command and its associated data were successfully received; <i>data</i> optionally contains a null-terminated text message.
e	Indicates that a command was not successfully received, i.e., it had a bad type, size, or checksum, and should be re-sent; <i>data</i> optionally contains a null-terminated text message.
g	Indicates that a group of <i>z</i> and/or <i>p</i> packets follows, terminated by a <i>d</i> or <i>e</i> packet (<i>d</i> for complete group, <i>e</i> for incomplete group)
h	Indicates that <i>data</i> contains a zero-terminated Bluetooth® connection string (of printable ASCII characters): IIII BBBBBBBBBBBBB L where: IIII is the storage index BBBBBBBBBBBBBB is the Bluetooth® Device Address (twelve hexadecimal digits) L is “y” if link key stored, “n” if no link key stored

i	<p>Indicates that <i>data</i> contains the zero-terminated Reader information string (of printable ASCII characters and TAB) in the following format:</p> <p>VVVVWWWXXXXSSSSSSSSSSAODYYYYHHIIIIJJJJKKKKLLLL<TAB>Z...Z</p> <p>where:</p> <p>VVVV is the application firmware version number; WWW is the bootloader firmware version number; XXXX is the radio firmware version number; SSSSSSSSSS is the Reader's serial number (ten digits); A is "A" if running firmware is the application, "B" if bootloader; OO is the OEM identifier; D is "D" if and only if the unit has a keypad and display (otherwise, it may be any other printable ASCII character); YYYY is the flash file system version number; HH is the hardware type identifier: 00 simulator 01 CR1 02 CR2/CR3 03 CR2-based OEM module 04 CR1200</p> <p>IIII is the hardware version number JJJJ is the maintenance utility version KKKK is the operating system kernel version LLLL is the root file-system version <TAB> is the ASCII TAB character; Z...Z is the OEM decoder version: a string of up to 16 printable ASCII characters</p> <p>At least VVVVWWWXXXXSSSSSSSSSSA will be present. Depending on hardware type and firmware version, one or more of the other fields (and the tab character) may be omitted. For fields to the left of the tab character, if a given field is present, all fields to the left of it will also be present.</p>
m	Indicates that <i>data</i> contains a message (comment). The <i>m</i> packets are not sent when the Reader is in "raw" mode.
p	Indicates that <i>data</i> contains a portion of a compressed or uncompressed image
r	Indicates that the Reader attempted but failed to read a code. (This packet is sent only if the Reader is configured to notify the Host on unsuccessful read attempts.)
z	<p>Indicates that the packet contains data decoded from a code; <i>data</i> contains the data decoded from the code.</p> <p>The <i>z</i> type packets do not use the <i>codeXML-start</i>, <i>packet-type</i>, or <i>codeXML-end</i> fields.</p>

In "raw" mode (as opposed to "packet" mode), type **m** packets are not sent, only the decoded data is sent for type **z** packets, and all other packets are sent without the *packet-start* and *crc16* fields. In "packet-mode," the *packet-start* and *crc16* fields are always sent. (See Figure 1.)

Raw Mode

'z' (data) packet:

data

'i' (non-z) packet:

CodeXML® 'i' response

CodeXML-start				packet-type	data	CodeXML-end
SOH	'X'	RS	'ap/'	'i'	VVVV...	EOT

Packet Mode Version 1

'z' (data) packet:

packet-start								data	packet-end
SOH	'X'	'R'	'I'	Reader ID (4 bytes)	packet number (1 byte)	time stamp (4 bytes)	data size (2 bytes)	data	crc16 (2 bytes)

'i' (non-z) packet:

packet-start								CodeXML [®] ‘i’ response							packet-end
SOH	‘X’	‘R’	‘I’	Reader ID (4 bytes)	packet number (1 byte)	time stamp (4 bytes)	data size (2 bytes)	SOH	‘X’	RS	‘ap/’	‘i’	VVVV...	EOT	crc16 (2 bytes)

Packet Mode Version 0

'z' (data) packet:

packet-start							data	packet-end
SOH	'X'	'R'	'0'	packet number (1 byte)	time stamp (3 bytes)	data size (2 bytes)	data	crc14 (2 bytes)

<i>'i'</i> (non-z) packet:													
packet-start							CodeXML [®] 'i' response						packet-end
SOH	'X'	'R'	'0'	packet number (1 byte)	time stamp (3 bytes)	data size (2 bytes)	SOH	'X'	RS	'ap/'	'i'	VVVVWWWWXX XXSSSSSSSSSP	EOT crc14 (2 bytes)

Figure 1: Example 'z' and 'i' Packets in Raw and Packet Modes

Optionally, whenever the Host receives a packet, the Host will respond by sending a *Y* or *R* packet (defined in the *Host to Reader Communication* section) to the Reader. If the expectResponse option is enabled in the Reader configuration, the Reader will repeatedly retransmit the packet (a configurable number of times) until it receives a *Y* packet.

If a packet received by the Host has a *packet-type* that is not any of the valid types listed above or has the same *packet-number* as the last processed packet of the corresponding type (command or data), the entire packet – up to and including *end* or until timeout – should be discarded by the Host. If the Host had requested a response, it should reissue the request.

If a packet received by the Host from the Reader fails its CRC, the Host should send an *R* packet to the Reader to request that the packet be resent.

6 Host to Reader Communication

Commands and data from the Host to the Reader are sent in the form of *commands* as specified in this section.

Commands are normally sent in USB Native, RS232, and Bluetooth[®] modes. Commands may not be sent via keyboard modes.

Two command formats are supported: **text-command** and **packetized-command**. Text-command format is applicable to RS232 and Bluetooth[®] modes but only if the Reader is configured to accept this format. Packetized-command format is applicable to all interfaces.

text-command: See Section 6.1.

normal-command: See Section 6.2.

After the Host sends each complete command, it should wait for a response packet from the Reader. Expected responses are specified along with the command types in section 6.3. If the Reader responds with an *e* packet or doesn't respond within a reasonable timeout period, the Host should resend the command a reasonable number of times.

6.1 Text Commands

Text commands may be sent to the Reader in RS232, USB Virtual COM mode, or RF mode using any serial communications software, e.g., HyperTerminal. Text commands may also be sent via the USB and

code

Serial Downloader programs using files with the .crb file extension. The .crb file contains one command per line in the same format as *text-command*. (See Section 10).

Encoded-data is decoded by the Reader by replacing %xx by a single byte with the value specified by the two hex-digits xx, e.g., **%25** would be replaced by character number 0x25, which is ASCII %.

text-command: *command-type encoded-data_{opt} carriage-return*

command-type: Single ASCII character in the set defined in Section 6.3

encoded-data: *encoded-datum*
 / *encoded-data encoded-datum*

encoded-datum: *printable-character / % hex-digit hex-digit*

printable-character: any byte value in the range [0x20,0x7e]

hex-digit: **'0' | '1' | '2' | '3' | '4' | '5' | '6' | '7' | '8' | '9'**
 | **'A' | 'B' | 'C' | 'D' | 'E' | 'F'**
 | **'a' | 'b' | 'c' | 'd' | 'e' | 'f'**

carriage-return: **0x0d**

In order to eliminate inadvertent commanding of the Reader, Text Commands are disabled by default (in firmware version 2216+).

To enable Text Commands requires an initial sequence: ;>PAx where x is as defined in section 8, register setting 41. (Note: 'A' is the ASCII character that corresponds to 41 HEX.)

For example, to send the Reader commands by typing commands in HyperTerminal:

```
; >PA1
P(xx)yy
P(xx)yy
~
PA8
```

Where **; >PA1** enables text commands with echo and command responses; **P%xyyy** can be any desired commands; ~ saves the settings just sent (the ~ command saves all but communication-related settings); and **PA8** turns text commands back off (except for the initial sequence). (Note: 'A' is the ASCII character that corresponds to 41 hex, thus P%418 would be equivalent.)

Note: **; >PA1** is used for interactive text commands. If the commands are to be saved in a file and sent non-interactively, use **; >PA7** instead; this enables text commands but disables echo and command responses. (See Section 6.3, Section 8, and Section 10 for additional information.)

The following two examples can be sent to a Reader in RS232 mode from HyperTerminal by just typing the example text.

Example 1 (make the Reader beep/vibrate 3 times):

##03 *Expected output: should make Reader beep/vibrate 3 times*

Example 2 (set Reader to continuous-read, near field only):

P(C4)5*Expected output: should set Reader to continuous-read, near field only*

6.2 Packetized Commands

Packetized commands consist of packetized data sent from Host to Reader to configure and cause the Reader to perform certain functionalities (e.g. CodeXML[®] rules, and settings). Packetized commands are always enabled, unlike text commands. In addition, they include error detection data, making them more robust than text commands.

normal-command: *prefix command-type data-size data_{opt} reserved crc14*

prefix: **0xEE 0xEE 0xEE 0xEE**

command-type: Single ASCII character in the set defined in Section 6.3

data: *datum*
 / *data datum*

datum: any byte value in the range [0,255]

data-size: byte value in range [0,240], which indicates size of *data* (in bytes)

reserved: **0x00**

crc14: two consecutive bytes, each in range [0,127], representing crc16 bitwise AND with 0x7f7f, most significant byte first. The packet crc16 is calculated over the entire packet, excluding the *prefix* and the *crc14* itself. (See source files *crc16.[hc]* (Appendix) for details on the crc16 algorithm and polynomials to be used.)

6.3 Command Types

ESC	Reserved for use by JavaScript applications. This command can be used to notify JavaScript functions from a B-String. No defined function in firmware or CodeViewer JavaScript. (The Reader will respond with d or e.)
#	Causes the Reader to beep and/or vibrate the specified number of times; <i>data</i> contains the number as a single character in the range [0,127]. (The Reader will respond with d or e.) Example – beep/vibrate three times: ##03

code

\$	<p>Posts a simulated button event to the Reader; <i>data</i> contains the event number as a single character. See register 39 in Section 8 for a list of the event numbers.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>Example – read both near and far fields: \$%03</p>
(<p>Causes the Reader to upload any logged error messages (no <i>data</i>)</p> <p>(The Reader will respond with a <i>g</i> packet, zero or more <i>z</i> packets, and a final <i>d</i> or <i>e</i>. Each <i>z</i> packet contains a portion of the requested data in its <i>data</i> field. Note: this is very similar to the response to the X command; however, <i>p</i> packets are not applicable and the <i>g</i> and <i>d/e</i> packets are not suppressed even in raw mode.)</p>
)	<p>Causes the Reader to erase its log of error messages (no <i>data</i>)</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>
*	<p>Causes the Reader to deactivate all top-level CodeXML[®] rules (no <i>data</i>)</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>
+	<p>Causes the Reader to activate a CodeXML[®] rule <i>data</i> specifies the rule number as a string of ASCII decimal digits</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>
,	<p>Causes the Reader to send a list of current Reader settings (no <i>data</i>)</p> <p>(The Reader will respond with <i>d</i> containing a space-separated list of all setting values (in order, expressed as hexadecimal ASCII characters) or with <i>e</i>.)</p>
-	<p>Causes the Reader to deactivate a CodeXML[®] rule; <i>data</i> specifies the rule number as a string of ASCII decimal digits</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>

.	<p>Causes the Reader to flash its LEDs; <i>data</i> contains four bytes:</p> <p style="text-align: center;">LEDs repetitions onTime offTime</p> <p>LEDs specifies the state of the LEDs: 1 to turn on, 0 to turn off:</p> <table><tr><th>Bit</th><th>LED</th><th>Applicable Hardware</th></tr><tr><td>7</td><td>reserved, always 0</td><td>CR2, CR3</td></tr><tr><td>6</td><td>left blue</td><td>CR2</td></tr><tr><td>5</td><td>left green</td><td>CR2</td></tr><tr><td>4</td><td>left red</td><td>CR2</td></tr><tr><td>3</td><td>center green</td><td>CR3, CR1200</td></tr><tr><td>2</td><td>center red</td><td>CR3, CR1200</td></tr><tr><td>1</td><td>right green</td><td>CR2</td></tr><tr><td>0</td><td>right red</td><td>CR2</td></tr></table> <p>Both onTime and offTime are specified in 1/100th seconds (max 2.55 seconds).</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>Example – flash left LED amber 3 times, ½ second on, 1 second off:</p> <p style="text-align: center;">.%30%03%32%64</p>	Bit	LED	Applicable Hardware	7	reserved, always 0	CR2, CR3	6	left blue	CR2	5	left green	CR2	4	left red	CR2	3	center green	CR3, CR1200	2	center red	CR3, CR1200	1	right green	CR2	0	right red	CR2
Bit	LED	Applicable Hardware																										
7	reserved, always 0	CR2, CR3																										
6	left blue	CR2																										
5	left green	CR2																										
4	left red	CR2																										
3	center green	CR3, CR1200																										
2	center red	CR3, CR1200																										
1	right green	CR2																										
0	right red	CR2																										
/	<p>Toggle a bit (or bits) in a Reader setting; <i>data</i> contains a printable ASCII string in the following format: hexadecimal setting number in parentheses followed by a 32-bit signed integer value, expressed in ASCII hexadecimal characters (with optional minus sign) or ASCII decimal characters preceded by the ‘#’ character, e.g., /(2e)1000 or /(2e)#4096; the specified integer is XORed with the existing setting value.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>Note: see Section 8 for possible Reader settings.</p>																											
1	<p>Indicates the start of a file download; <i>data</i> is empty. This command is followed by a sequence of 2 commands containing the file data and a download-end command (e.g., 5).</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>																											
2	<p>Indicates a continuation of a file download; <i>data</i> contains the next portion of the file data.</p> <p>(The Reader will not send any response.)</p>																											
5	<p>Indicates the end of a regular file download; <i>data</i> contains the name of the file, which is from 1 to 200 letters, digits, periods, hyphens, and underscores, terminated with ASCII NUL.</p> <p>(The Reader will respond with <i>d</i>, <i>e</i>, or <i>f</i>.)</p> <p>Note: This command is supported in firmware version 3100+</p>																											

code

9	<p>Requests the Reader to delete a file from its storage; <i>data</i> contains the file name, terminated with ASCII NUL.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>Note: Supported in firmware version 3100+</p>
:	<p>Requests the Reader to send configuration <i>data</i> to the radio module</p> <p>(The Reader will respond with zero or more <i>h</i> followed by a <i>d</i> or an <i>e</i>.)</p> <p>For example, <i>data</i> consisting of a single zero byte will cause the radio to disconnect from the Host. (See Section 9: Radio Commands.)</p> <p>This command is valid for Firmware versions 2012+</p>
;	No operation (may be used for comments in command files)
<	<p>Causes the Reader to send a list of saved Reader settings (no <i>data</i>)</p> <p>(The Reader will respond with <i>d</i> containing a space-separated list of all setting values (in order, expressed as hexadecimal ASCII characters) or with <i>e</i>.)</p>
=	<p>Puts setting directly to Reader's non-volatile memory so that it will take effect upon next reboot; <i>data</i> is as defined in the / command; the specified integer replaces the existing setting value.</p> <p>Note: this command can be used to set communication modes without losing communication during the process.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>This command is valid for Firmware versions 2230+</p>
>	<p>Causes the Reader to send a string of text to the Host as a <i>z</i> packet; <i>data</i> contains the text to send.</p> <p>(The Reader will respond with a <i>z</i> packet containing the text.)</p>
?	<p>Programs the JavaScript, GoCode[®], or other license; <i>data</i> contains the encrypted license data.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>This command is valid for Firmware versions 2232+</p>

@	<p>Causes the Reader to reset its internal date/timestamp to the specified time; <i>data</i> contains the date and/or time in one of the following formats.</p> <pre> yyyy-mm-dd hh:mm:ss yyyy-mm-dd hh:mm hh:mm:ss hh:mm </pre> <p>Note: the separators are optional; only digits are significant.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>Examples:</p> <pre> Set to midnight: @00:00 Set to Sept 1, 2005 11:52:02 PM: @2005-09-01 23:52:02 </pre> <p>Note: on units without a battery-backed real-time clock, the date and time will reset to 2000-01-01 00:00:00 upon power-up.)</p> <p>Command enhanced with version 2526+ to include year/month/day information</p>
A	<p>Notifies the Reader that the previously sent data were rejected for one of the following reasons:</p> <ul style="list-style-type: none"> the packet was encrypted and the decryption failed; the Host (CodeXML[®] Bluetooth[®] Modem) is locked to a different Reader. <p>The Reader should indicate to the user that the packet has been rejected; e.g., it may sound error beeps. See related setting 0x12f, notify-of-packet-rejection.</p> <p>(The Reader will not respond to the Host.)</p> <p>This command is valid for Firmware versions 3280+</p>
B	<p>Defines the strings the Reader will return (or process internally) in response to stored-command-code events; <i>data</i> contains the event number of the stored-command-code as a single byte (in the range 0x09..0x48) followed immediately by the associated null-terminated string. B-strings are “performance” strings used to enhance/enable specific Reader functions and capabilities.</p> <p>0x09 – 0x0C: reserved for OEM</p> <p>0x0D – 0x24: reserved for Code Corporation Functions</p> <pre> 0x0D Performance String A1 0x0E Performance String A2 0x0F Performance String A3 0x10 Reserved as of firmware version 2526 0x11 Performance String B1 0x12 Performance String B2 0x13 Performance String B3 0x14 Performance String C1 0x15 Performance String C2 0x16 Performance String C3 </pre>

	<p>0x17 Performance String D1 0x18 Performance String D2 0x19 Performance String D3 0x1a reserved 0x1b reserved 0x1c Performance String SB 0x1d Performance String SN 0x1e Performance String SF 0x1f Performance String VB (Obsolete) 0x20 Performance String VN (Obsolete) 0x21 Performance String VF (Obsolete) 0x22 Performance String AB (Obsolete) 0x23 Performance String AN (Obsolete) 0x24 Performance String AF (Obsolete) 0x25 – 0x47: for user applications 0x48 User defined “No Read” value (see register 55 in Section 8) (The Reader will respond with <i>d</i> or <i>e</i>.) Example –B-string setting SXGA Near Field Window: B%0D%01X%1d%02P%54#1024%04 B-strings 0x0D through 0x24 are restored using J command as of version 2526. Performance strings are included with app download and do not require a separate download as of version 2526. See “Appendix: B-string Settings” for complete details. Note: Due to increased image capture speed. VGA support was removed in version 4508 (CR2/CR3) and 4180 (CR1200). VGA was never support in CR2500/3500. Note: CR1200 supports B-strings beginning in version 4189.</p>
G	<p>Get setting from Reader; <i>data</i> contains a single character (0-255), which is the setting number. (The Reader will respond with <i>d</i> and the setting value as a sequence of 8 ASCII hexadecimal digits or with <i>e</i>.) Example - determine if Rectangular Data Matrix is enabled: G%16 Note: see Section 8 for possible Reader settings.</p>
I	<p>If data is blank the Reader to send its information string (no <i>data</i>). The Reader will respond with <i>i</i> or <i>e</i> packet. If data is No data, see ‘i’ response in section 5.</p>

J	Requests the Reader to restore settings to factory defaults (no <i>data</i>). (The Reader will respond with <i>d</i> or <i>e</i> .)
L	Requests the Reader to send a list of its stored files; <i>data</i> is either empty or contains “1”; hidden files are listed only if “1” is specified. (Hidden files are files whose names begin with a period.) (The Reader will respond in the same manner as with the ‘(’ command, each <i>z</i> packet containing a file name as a NUL-terminated string of printable ASCII characters.) Note: Supported in firmware version 3100+
N	Requests the Reader to delete stored data and images (no <i>data</i>). (The Reader will respond with <i>d</i> or <i>e</i> .)
O	Set a bit (or bits) in a Reader setting; <i>data</i> is as defined in the / command; the specified integer is ORed with the existing setting value. (The Reader will respond with <i>d</i> or <i>e</i> .) Note: see Section 8 for possible Reader settings.
P	Put setting to Reader; <i>data</i> is as defined in the / command; the specified integer replaces the existing setting value. (The Reader will respond with <i>d</i> or <i>e</i> .) Example – enable Rectangular Data Matrix (setting 0x16, value 1): P%161 Note: see Section 8 for possible Reader settings.
Q	Clear a bit (or bits) in a Reader setting; <i>data</i> is as defined in the / command; the ones-complement of the specified integer is ANDed with the existing setting value. (The Reader will respond with <i>d</i> or <i>e</i> .) Note: see Section 8 for possible Reader settings.
R	Requests that the previously sent packet be re-sent by the Reader; <i>data</i> may specify a maximum packet size the receiver will accept: <i>data</i> is either empty or specifies a 16-bit big-endian unsigned integer (2 bytes). If <i>data</i> is empty or specifies a size less than 32 (the minimum packet size), the Reader will use its preferred maximum packet size. Otherwise, it will use the specified max packet size (or less) and will fragment data across multiple smaller packets when necessary. (The Reader will respond by resending its previous packet or with <i>e</i> if there was no previous packet. If the max data size has changed, it may resend the previous data in a sequence of more than one packet.)

T	<p>Requests the current date and time (no <i>data</i>)</p> <p>(The Reader will respond with <i>d</i> with <i>data</i> containing the date and time formatted as yyyy-mm-dd hh:mm:ss.)</p> <p>Note: on units without a battery-backed real-time clock, the date and time will reset to 2000-01-01 00:00:00 upon power-up.</p> <p>Supported in firmware version 2526+</p>
U	<p>Requests the Reader to delete all stored files including data, images, and JavaScript files (no <i>data</i>)</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>Supported in firmware version 2526+</p>
W	<p>Requests the Reader to write its current settings from RAM to its non-volatile memory.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>
X	<p>Initiates data transfer from Reader memory to Host; <i>data</i> specifies whether only buffer data or all data (buffer and log) should be sent: if empty, all data are sent; otherwise, 0 requests only buffer data and 1 requests all data (buffer and log).</p> <p>Note: if the autoLogErase setting is nonzero, the log data are cleared after being successfully sent.</p> <p>(The Reader will respond with a <i>g</i> packet, zero or more <i>z</i> or <i>p</i> packets, and a final <i>d</i> or <i>e</i>. In raw mode, the <i>g</i> and <i>d</i> or <i>e</i> packets are omitted; thus if there are no data stored then no response will arrive.)</p>
Y	<p>Acknowledge the receipt of a packet; <i>data</i> specifies the received packet number (one byte).</p> <p>(The Reader will not respond.)</p>
Z	<p>Request the Reader to reboot; <i>data</i> is either empty or contains '1'; if it contains 1, the Reader will reboot into boot loader mode.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i> before it reboots.)</p> <p>Enhanced to include the Z1 feature in firmware version 2526+</p>
\	<p>Returns a string previously stored with the <i>B</i> command; <i>data</i> contains the event number of the stored-command-code as a single byte.</p> <p>(The Reader will respond with a <i>d</i> packet containing the requested null-terminated string or with <i>e</i> (e.g., if the specified event number is out-of-range).)</p> <p>See "Appendix: B-string Settings" for complete details.</p>

^	<p>Requests the Reader to upload the specified stored file; <i>data</i> contains the file name, terminated with ASCII NUL.</p> <p>(The Reader will respond in the same manner as with the ‘(’ command with the following additions: in the <i>g</i> packet, <i>data</i> contains the filename followed by a tab character, followed by the file’s size in parentheses (e.g., “test.txt (1292)”); in the <i>d</i> packet, <i>data</i> contains “EOF” followed by a tab character, followed by the file’s CRC16 in parenthesis (e.g., “EOF (13626)”).)</p> <p>Supported in firmware version 3100+</p>
–	<p>Causes the Reader to wait for all buttons to be released and clear its event queue</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>
	<p>Sends <i>data</i> to the Reader. The <i>data</i> may be intercepted by the JavaScript application on the Reader; otherwise, it will be processed as if read from a code.</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p>
~	<p>Requests the Reader to write some of its current settings from RAM to its non-volatile memory. All settings are written <i>except</i> the communication settings (commMode, commProtocol, commExpectResponse, and commandOptions, uartBaud, etc.)</p> <p>(The Reader will respond with <i>d</i> or <i>e</i>.)</p> <p>This command is valid for Firmware versions 2230+</p>

7 File Installation

7.1 Simple Protocol

The file is split into blocks of 236 or less bytes each and downloaded to the Reader via *1*, *2*, & *5* commands using the following sequence:

- 1) Send a *1* command to initialize the download.
- 2) Wait for a *d* or *e* response from the Reader or a timeout.
 - a) If timeout or *e* response, restart the sequence at step 1.
 - b) If *d* response, continue to step 3.
- 3) Send a series of 2 commands, each with a portion of the file. (The Reader will not send any response.)
- 4) Send a *5* command to end the download and install the file.
- 5) Wait for a *d*, *e*, or *f* response from the Reader or a timeout.
 - a) If *f* response or timeout, restart the sequence at step 1.
 - b) If *e* response, repeat step 5.
 - c) If *d* response, file download has completed successfully.

Note: the timeout will need to be increased from the normal response timeout to allow the firmware time to write the file to the flash memory.

8 Reader Settings

The Host sets the Reader settings using the /, O, P, Q, and = commands and reads them using the G, ,, and < commands.

For example, the following P command sets register 2e to the value 7f.

```
P(2e)7f
```

Note: for two-digit setting numbers (i.e., settings 00 through fd), an alternative format may be used: in place of the parentheses and hexadecimal setting number, substitute a single character, which represents the setting number. The equivalent to the example above is P.7f (the ASCII ‘.’ character has the hexadecimal value 2e). (In certain circumstances, such as with text-commands, “percent-encoding” may be used for encoding a character as a sequence consisting of the percent character followed by two hexadecimal digits. With percent-encoding, the example may be expressed as P%2e7f.)

In the table below, the **Reg** column is the register setting number, in **hexadecimal**, to be used with the commands identified above. In the **Default** column, all values are in **hexadecimal** unless otherwise specified. To use decimal values in commands you must precede the data with a pound sign ‘#’. The following P command sets register 2e to the same value as the example above:

```
P(2e)#127
```

Since the single digit values of 0 through 9 are identical in decimal and hexadecimal, no indicator is needed.

8.1 Binary Dip Switch

Some registers are what Code terms a ‘Binary Dip Switch’ where the value of each bit of the data string switches on or off some part of the behavior of that register. The bits are numbered from least significant to most, a.k.a. right to left. Each bit can be on or off (1 or 0).

An example of this is register 0a, ‘nec2of5Options’. The following settings are possible:

Bit (R to L)	Controls	Value
0	NEC2of5 Decoding	0: Disable
		1: Enable
1	Checksum checking	0: Disable
		1: Enable
2	Strip checksum from the result	0: Disable
		1: Enable
3	1 Digit Symbol Allowed	0: Disable
		1: Enable
4	2 Digit Symbol Allowed	0: Disable
		1: Enable

Given the settings above, the binary string to turn on NEC 2 of 5 decoding with checksum checking with the checksum stripped from the result string, allowing 2 digit symbols is 10111 (bits left to right). The same string would be 0x17 or decimal 23

Thus, the command to implement the settings above would be:

P(0a)17

Or

P(0a)#23

8.2 Reader Settings Table

Note: If only one default value is shown then this value is applicable and identical to both CR2/CR3 and CR1200. All differences in the settings use or default value will be noted.

2c	Extra Time in Active Mode When Cable is Connected (extraCabledActiveTime_ms)	6DDD00 (#120*60*1000 (7200000 ms or 2 hours))	Valid Range: 0 to 7FFFFFFF Milliseconds Active Mode is the time between the last user interaction with the Reader (button press, etc.) and Power-Saving Idle Mode. This setting increases Active Mode time only when the Reader is cabled. Power Usage: 4 out of 4 Next state: Idle Note: in “continuous read” mode, this is also the continuous read timeout period. Also see registers: 32, 88, 8e, 9e, 9f
2d	Keyboard Maps (kbMap)	0	0: US English (without leading 0 in the alt _ Num) 1: ASCII (alt+number) - universal 2: Custom (requires user to download keyboard map) 3: US English (with leading 0 in the alt + num for non-printable ASCII) 4: French Keyboard 5: German Keyboard 6: Japanese Keyboard 7: US English (with ctrl + char for non-printable ASCII) Note: Supported in firmware version 2394+ Note: These settings will not be reset by factory defaults
32	Time in Active Mode (activeTime_ms)	493E0 (#5*60*1000 (300000 ms or 5 minutes))	Valid Range: 0 to 7FFFFFFF Milliseconds. Active Mode is the time between the last user interaction with the Reader (button press, etc.) and Power-Saving Idle Mode. Power Usage: 4 out of 4 Next state: Idle Note: in “continuous read” mode, this is also the continuous read timeout period. Also see registers: 2c, 88, 8e, 9e, 9f
34	Maximum Candidate Decodes Per Read (maxStickyDecodes)	1	The Reader will process up to this number of codes per “read code” event. If there are more than this many codes in the field of view and within target tolerance, only the first ones will be decoded. For fastest performance with single codes, set to 1. Also see register 44
35	Button Stay-Down Time (stickyTime_ms)	0	Valid Range: 0 to 7FFFFFFF Milliseconds Keep processing the “read code” events for this amount of time (act as if the button sticks down for this time)

code

Reg	Setting Name	Default (hex)	Comment
36	Number of Control Frames Before Picture Capture (agcFramesBeforePicture)	6	Valid Range: 0 to 7FFFFFFF Frames Number of frames captured and discarded before live picture to give the gain control time to adjust. Also see registers: 43, ab, ac, ad, ae, af, b1
37	Host Acknowledgement Time Limit (HostAckTimeout_ms)	2BC (#700)	Valid Range: 0 to 7FFFFFFF Milliseconds After sending data to Host, the Reader waits up to this amount of time for the acknowledgement from Host before declaring failure.
39	Right Top Button (button1)	4	The specified event is posted upon press of this button. The events are defined below. 0: no action 1: keep awake 2: show target 3: read in near and far fields 4: defaultEvent (default) Selected by hardware - CR2/CR3 read in both fields - CR1200 read in near fields - CR2500 read in wide field 5: read in near/high density field 6: read in far/wide field 7: take picture 8: read in most recently successful field 9 – 71: execute stored command string indicated by value 72 – 254: reserved 255: idle
3a	Left Top Button (button2)	4	See register 39 for settings.
3b	Combination of Left and Right Buttons (button3)	CR2/ CR3: 0	Combination of buttons 1 and 3. See register 39 for settings.
3c	Handle Button (button4)	CR2/CR3:4 CR2500/CR3500: 4 CR1200:4	See register 39 for settings. Note: This is the register for the trigger button for the CR1200.
40	Text Command Timeout (HostPacketTimeout_ms)	2AF8 (#11000)	Valid Range: 0 to 7FFFFFFF Milliseconds The maximum time during which a complete text command from Host must be received. (Pending text command data is discarded when the timeout is exceeded.)

Reg	Setting Name	Default (hex)	Comment																					
41	Text Commands (commandOptions)	8	<div><div><table><tr><th>Bit</th><th>Controls</th><th>Value</th></tr><tr><td>0</td><td>Text Commands</td><td>0: Disable 1: Enable</td></tr><tr><td>1</td><td>Suppress Echo</td><td>0: Disable 1: Enable</td></tr><tr><td>2</td><td>Suppress Responses</td><td>0: Disable 1: Enable</td></tr><tr><td>3</td><td>Disable Text Commands but Enable Magic Sequence; See Below</td><td>0: Disable 1: Enable</td></tr><tr><td>4</td><td>Suppresss URL Decode; See Below</td><td>0: Disable 1: Enable</td></tr><tr><td>5</td><td>Accept On Timeout</td><td>0: Disable 1: Enable</td></tr></table></div><div><p>Magic Sequence: The Magic Sequence is the string “;>PAx” where x is 1, 3, or 7 as defined above. This would normally be used in command text files, which would begin with the text-command-on sequence and end with the command to return to this special mode. For example:</p><p>;>PA7 ;any desired commands here PA8</p><p>Note: ;>PAx is supported in firmware version 2210+</p><p>Additional settings in firmware version 3430+</p><p>Suppress URL Decode: For example, if enabled, P%418 will not equal PA8. The % is not recognized as an escape character</p><p>Accept On Timeout: Note: See register 156 for details</p></div></div>	Bit	Controls	Value	0	Text Commands	0: Disable 1: Enable	1	Suppress Echo	0: Disable 1: Enable	2	Suppress Responses	0: Disable 1: Enable	3	Disable Text Commands but Enable Magic Sequence; See Below	0: Disable 1: Enable	4	Suppresss URL Decode; See Below	0: Disable 1: Enable	5	Accept On Timeout	0: Disable 1: Enable

86	Motion Detection Event (motionEvent)	0	Valid Range: 0: Disable When motion is detected, this event is posted. See register 39 for list of events.												

Reg	Setting Name	Default (hex)	Comment
87	Motion Detection Sensitivity (motionThresh)	CR2x: 19 (#25) CR1200: F (#15)	Valid Range: The sensitivity of motion detection. Lower numbers make detection more sensitive; higher numbers, less sensitive.
88	Time in Sleep Mode (sleepTimeout_sec)	1C20 (#2*60*60 (7200 sec or 2 hours))	Valid Range: 0 to 7FFFFFFF Seconds Sleep Mode is the time between Standby Mode and Power Off Mode. The Reader can wake up out of Sleep Mode without having to reboot resulting in a quicker transition to Active Mode. Other than the quicker transition to Active Mode and slightly higher power usage, the Reader is in a state very similar to Power Off. Power usage: 1 out of 4 Communications: Disabled Previous state: Standby Next state: Power Off (which uses no power) Also see registers: 2c, 32, 8e, 9e, 9f
89	Bluetooth® PIN (bluetoothPin)	12345678 (String)	Value of the Bluetooth® Pin sent if the Host requests a pin. Note: See register 173 Note: Supported in firmware 3514+
8e	Time in Idle Mode (idleTimeout_sec)	5A (#90)	Valid Range: 0 to 7FFFFFFF Seconds Idle Mode is the time between Active Mode and Standby Mode. The Reader can transition to Active Mode very rapidly. Other than the quicker transition to Active Mode and slightly higher power consumption, the Reader is in a state very similar to Standby Mode. Power usage: 3 out of 4 Communications: Enabled Previous state: Active Next state: Standby Also see registers: 2c, 32, 88, 9e, 9f

Reg	Setting Name	Default (hex)	Comment
93	Suppress Beep On Decode (suppressBeepOnDecode)	0	<p>0: beep indicating decode before JavaScript processing 1: call JavaScript without beeping to indicate decode</p> <p>Normally, the Reader beeps as soon as decodes are read and processes them via JavaScript if necessary <i>after</i> the beep. To enable JavaScript to control the beep feedback, change this setting to 1; this will suppress the beep; the JavaScript would typically beep if the decode is valid or start another read cycle if it isn't.</p> <p>This setting does not suppress beeps for anything but a successful decode event.</p> <p>Note: supported in firmware version 3100+</p>
9c	Laser Brightness (targetBrightness_percent)	64 (#100)	Valid Range: 0 to 64 (#100) Percent
9d	Target Tolerance (targetTolerance_percent)	640 (#1600)	<p>Valid Range: 0 to 7FFFFFFF Percent</p> <p>For the Reader to accept a code, the target dot must be within the code rectangle or in proximity to the symbol. The nearness is defined as this percentage of the code's smaller dimension. For example, with a 10 x 20 mm code and a setting of 150 (%), the target dot must be within 15 mm of the code.</p> <p>Any value over 1000 is considered infinite tolerance, and no target checking is performed.</p>
9e	Extra Time in Idle Mode When Cable is Connected (extraCabledIdleTime_sec)	7FFFFFFF (#596523*60* 60 (2147483647 sec or ~596523 hours))	<p>Valid Range: 0 to 7FFFFFFF Seconds</p> <p>Idle Mode is the time between Active Mode and Standby Mode. The Reader can transition to Active Mode very rapidly. Other than the quicker transition to Active Mode and slightly higher power consumption, the Reader is in a state very similar to Standby Mode.</p> <p>Power usage: 3 out of 4 Communications: Enabled</p> <p>Previous state: Active Next state: Standby</p> <p>Also see registers: 2c, 32, 88, 8e, 9f</p>

Reg	Setting Name	Default (hex)	Comment
9f	Time in Standby Mode (standbyTimeout_sec)	0	Valid Range: 0 to 7FFFFFFF Seconds Standby Mode is the time between Idle Mode and Sleep Mode. Standby Mode has lower power consumption but is in a state very similar to Idle Mode. Power usage: 2 out of 4 Communications: Disabled but the radio maintains its connection (RF mode) Previous state: Idle Next state: Sleep Note: supported in firmware version 2526+ Also see registers: 2c, 32, 88, 8e, 9e
a1	Vibrate (vibrate)	CR2/CR3: 0 CR1200: 1 CR2500/3500: 1	0: Disable 1: Enable: vibrator will be on at same time as speaker Note: if vibrate-only is desired, set speaker volume to 0.
a2	Default Event Delay (defaultEventDelay_ms)	0	Valid Range: 0 to 7FFFFFFF Milliseconds The Reader will pause for this amount of time between each posting of the default event (used with “continuous read” mode). Also see register c4.
a7	Beep (Vibrate) Pulse Separation (beepSeparation_ms)	CR2/CR3: 14 (#20) CR1200: 64 (#100)	Valid Range: 0 to 7FFFFFFF Milliseconds The spacing in milliseconds between beeps. Also see registers: 26, 59
ab	AGC Selection for Taking Pictures (useImagerAgcWithTakePicture)	0	0: use decoder AGC (designed for Symbology decoding) 1: use imager AGC (optimized for pictures) Also see registers: 36, 43, ac, ad, ae, af, b1
ac	Picture Window Left Position (pictureWindowX)	0	Specify position and size of window used with “take picture.” The position and size are relative to the virtual image (i.e., not the rotated physical image). Note: on Code Reader 2, overall image is 1024 x 1280. Upper half is far field; lower half is near field. Also see registers: 36, 43, ab, ad, ae, af, b1
ad	Picture Window Upper Position (pictureWindowY)	0	Also see register: ac
ae	Picture Window Width (pictureWindowWidth)	CR2/CR3: 400 (#1024) CR1200: 500 (#1280)	Also see register: ac

Reg	Setting Name	Default (hex)	Comment
af	Picture Window Height (pictureWindowHeight)	CR2/CR3: 280 (#640) CR1200: 400 (#1024)	Also see register: ac
b0	Laser Target on Before Picture (targetBeforePicture)	0	0: Laser off before picture capture 1: Laser on before picture capture Also see registers: 36, 43, ab, ac, ad, ae, af
b1	When to apply CodeXML [®] rules (configCodesBeforeCodeXm l)	2	0: Process configuration strings only before applying CodeXML [®] rules 1: Process configuration strings only after applying CodeXML [®] rules 2: Process configuration strings before and after applying CodeXML [®] rules Controls the sequence of processing configuration strings and applying CodeXML [®] rules.
b3	Time of retries before Reader gives up sending (commMaxSendAttempts)	3	Valid Range: 1 to 7FFFFFFF Note: The value 1 is defined as the original send attempt but no resends. Also see register: 42 (commExpectResponse)
b4	noStoreIfNotConnected	CR2/3: 0 CR1200: 1	0: normal buffer operation 1: nothing is stored in nonvolatile memory when there is not a valid connection. If there is no active connection and data would have otherwise been stored, the Reader will indicate this fact the same as with a storage-full condition.
bf	USB Keyboard Poll Rate (keyboardPollingPeriod)	CR2/CR3: A (#10) CR1200: 5	Valid Range: 1 to FF (#255) Milliseconds The Host is requested to poll the USB device at the specified period.
c4	Default (Continuous) Event (defaultEvent)	FF (#255)	When no button is pressed but the Reader is still in active mode (i.e., not power-saving idle or sleep modes), this event will be posted. See register 39 for the list of events. The default value (idle event) disables “continuous scanning”; use one of the read events to enable “continuous scanning.”
c6	Auto Connect (autoConnectMode)	1	0: No Auto Connect - connect only on “X” and “:” commands and upload events 1: Auto Connect - attempt to establish connection when in idle mode and maintain connection when in standby mode 2: Auto Reconnect - attempt to connect when there is data to send but only within specified time of last valid connection. Also see register: ea. 3: Auto Connect If Cabled - attempt to connect if Reader is cabled or in charger Note: This functionality is implemented in the Codeviewer JavaScript application. If custom JavaScript is developed, caution must be taken to include this functionality.

Reg	Setting Name	Default (hex)	Comment
c7	SXGA Far Field Window Vertical Size (farFieldDecodeWindowWidth_pixels)	CR2/CR3: 280 (#640) CR2500/CR3500: 280 (#640)	Valid Range: 1 to 280 (#640) Pixels This setting is applicable to SXGA mode only.
c8	SXGA Far Field Window Horizontal Size (farFieldDecodeWindowHeight_pixels)	CR2500/CR3500: 400 (#1024)	Valid Range: 1 to 400 (#1024) Pixels This setting is applicable to SXGA mode only.
c9	interleave2of5Lengths	0	FFFFFFFC: 2 and 4 digit disabled FFFFFFFD: 2 digit enabled FFFFFFFE: 4 digit enabled Also see registers: 6e, 71
ca	Auto Disconnect (autoDisconnect)	0	0: retain connection until sleep or explicit disconnect command 1: disconnect from the Host when there is nothing to send. (In conjunction with autoConnect (c6) and autoBufferUpload (73), the Reader will connect when there is data to send, send the data, then disconnect (to allow another Reader to connect to the same Host).
cd	Codablock A Symbology (enableCodablockA)	0	0: Disable 1: Enable
ce	Codablock F Symbology (enableCodablockF)	0	0: Disable 1: Enable
cf	Macro PDF417 Symbology (macroPdf417)	0	0: Disable 1: Enable Also see registers: 29, 2a
d6	Ignore Duplicate Code (duplicateBlockTime_sec)	0	Valid Range: 0 (off) to 7FFFFFFF Seconds Consecutive duplicate codes (i.e., codes that contain the same data) are blocked for this amount of time (in seconds). Note: Deprecated , but maintain for backwards compatibility. If using 3430 or greater firmware, use register 159.
d8	Composite Linkage Control (compositeCodesRequireBothElements)	1	0: Accept any composite element 1: Only accept composite codes if both elements could be decoded. Also see register 4a.
d9	Max Connection Wait Time (connectTimeout_sec)	1E (#30)	Valid Range: 0 to 7FFFFFFF Seconds The Reader will attempt connection for up to this amount of time when a connection is explicitly requested, such as when a QuickConnect code is read or an upload is requested (by event or command).

9 Radio Commands

The Host controls the radio by issuing ‘:’ commands. The following table describes the available commands.

The ‘#’ column is the radio setting/command number (in hexadecimal) to be used with the ‘:’ command. For example, “: %0E” gets the Bluetooth® device address.

The ‘# bytes’ column indicates how many bytes of data are required as arguments for the command.

Name	#	Comments	# bytes
Disconnect	00	Terminate the current connection.	0

Name	#	Comments	# bytes
Auto Connect	07	If connection information exists for the specified Device Address, use it to establish a connection. Otherwise, attempt to establish a connection and store the resulting information.	6
Clear Setup	08	Remove connection information associated with the specified Bluetooth® Address.	6
Send Setup	09	Print all connection information in the following format	0
		iiii xxxxxxxxxxxx p	
		Where iiii is the storage index, xxxxxxxxxxxx is the Bluetooth® Device Address, and p indicates pairing enabled (y) or pairing disabled (n).	
Get Bluetooth® Address	0E	Get Bluetooth® address as 12 Hexadecimal characters	0
Get “user friendly” name	0F	Get device’s “user friendly” name	0

10 Code Reader Batch (CRB) System

The Code Reader Batch (CRB) system is a convenient method for creating and maintaining a set of commands that can be easily sent to the Reader. These CRB files can be created in any text editor with the file extension of .crb. The CRB system accepts all of the valid *text commands*. The most commonly used commands are *J*, *N*, *P*, and *~*. There should be one command per line. The CRB file may contain empty lines and comments as well.

The .crb files can be sent to the Reader using either the USB or RS232 downloader’s. As CRB files are just a list of *text commands*, they can also be sent by a serial terminal program. **Note: if using a serial terminal program the Reader will first need to be commanded in to “text command mode”; see Section 6.1.**

You can request a copy of all the CR2 User Manual configuration codes in the .crb format. For example, code M121_01 in the manual (setting the Bluetooth® radio timeout to 5 minutes) is the following:

File M121_01.crb:

```
P%9f#300
```

The CRB system allows for combining multiple functions into a single file. For example, you can create a test.crb file that contains commands to set the left trigger to B3 (M030_01), enable ALL RSS codes (M267_01), disable auto-transfer of buffer memory (M069_01), and make the Reader beep three times. Note you can also comment your CRB file with a semicolon (;) as shown below. A comment starts with a semicolon character and lasts till the end of the line. The *>PAX* sequence has special meaning. See Section 6.1.

File test.crb:

```
; This is a test file
;>PA7          ; enable text commands, no echo/responses (see Section 8, reg 41)
P%3A13        ; left trigger set to B3 performance (note that value 13 is in hex)
P%4c#31       ; enable ALL RSS codes (note that value 31 is in decimal)
P%730         ; disable Auto Transfer Buffer Memory
; beep Reader three times using a different type of sound
P%59#30       ; set Beep/Vibration Duration to 30 milliseconds
P%26#60       ; set Beep/Vibrate Volume to 60%
#%03          ; beep Reader 3 times
P%59#100      ; restore Beep/Vibration Duration to 100 milliseconds
P%26#100      ; restore Beep/Vibrate Volume to 100%
P(100)#6000   ; sets the backlight timeout to 6 seconds (6s is in decimal)
P(101)55      ; dimmers setting (LCD screed) to 85% (55 hex)
~             ; save settings (except communication-related settings)
PA8           ; turn off text commands (to avoid inadvertent commanding)
```

Non-printable ASCII (0x00-0x1F and 0x7F) and non-ASCII (0x80-0xFF) characters should be encoded. See Section 6.1. Also, the following characters have special meaning in a CRB file, thus they should be encoded if they are part of a command:

0x20 ‘ ’ (space): Space and tab characters mark the end of a command.

0x3B ‘;’ (semicolon): Semicolon characters mark the beginning of a comment.

11 Symbology Detail Settings

11.1 PharmaCode

PharmaCode setting register (f8) contains a number of settings that requires detailed explanation. Below is a list of valid register settings and detailed explanation.

0 = disable PharmaCode decoding (Default)

1 = enable PharmaCode decoding, no color bars expected; standard rules for all bars. Horizontally oriented symbols are decoded. Note that horizontally oriented means that the bars are perpendicular to the orientation of the pixel raster scan line. Decoding is performed in the “normal” direction (left bars more significant than right bars for horizontal symbols; top bars more significant than bottom bars for vertical symbols).

3 = enable PharmaCode decoding, Color bars expected; relaxed contrast rules for the three least significant bars. Horizontally oriented symbols are decoded. Note that horizontally oriented means that the bars are perpendicular to the orientation of the pixel raster scan line. Decoding is performed in the “normal” direction (left bars more significant than right bars for horizontal symbols; top bars more significant than bottom bars for vertical symbols).

5 = enable PharmaCode decoding, no color bars expected; standard rules for all bars. Vertically oriented symbols are decoded. Note that vertically oriented means that the bars are parallel to the orientation of

the pixel raster scan line. Decoding is performed in the “normal” direction (left bars more significant than right bars for horizontal symbols; top bars more significant than bottom bars for vertical symbols).

7 = enable PharmaCode decoding, Color bars expected; relaxed contrast rules for the three least significant bars. Vertically oriented symbols are decoded. Note that vertically oriented means that the bars are parallel to the orientation of the pixel raster scan line. Decoding is performed in the “normal” direction (left bars more significant than right bars for horizontal symbols; top bars more significant than bottom bars for vertical symbols).

9 = enable PharmaCode decoding, no color bars expected; standard rules for all bars. Horizontally oriented symbols are decoded. Note that horizontally oriented means that the bars are perpendicular to the orientation of the pixel raster scan line. Decoding is performed in the “reverse” direction (right bars more significant than left bars for horizontal symbols; bottom bars more significant than top bars for vertical symbols).

11 = enable PharmaCode decoding, Color bars expected; relaxed contrast rules for the three least significant bars. Horizontally oriented symbols are decoded. Note that horizontally oriented means that the bars are perpendicular to the orientation of the pixel raster scan line. Decoding is performed in the “reverse” direction (right bars more significant than left bars for horizontal symbols; bottom bars more significant than top bars for vertical symbols).

13 = enable PharmaCode decoding, no color bars expected; standard rules for all bars. Vertically oriented symbols are decoded. Note that vertically oriented means that the bars are parallel to the orientation of the pixel raster scan line. Decoding is performed in the “reverse” direction (right bars more significant than left bars for horizontal symbols; bottom bars more significant than top bars for vertical symbols).

15 = enable PharmaCode decoding, Color bars expected; relaxed contrast rules for the three least significant bars. Vertically oriented symbols are decoded. Note that vertically oriented means that the bars are parallel to the orientation of the pixel raster scan line. Decoding is performed in the “reverse” direction (right bars more significant than left bars for horizontal symbols; bottom bars more significant than top bars for vertical symbols).

12 OCR Template

12.1 OCR Introduction

OCR is designed to encompass both human readable and machine readable information in the same symbol or text. Conversely, bar codes were designed to greatly assist the ability of machines to read information at the expense of human readability. In OCR, there is little redundant information in a character; most of an OCR character must be present to allow recognition. There are subtle differences between some OCR characters that are easy for a human to distinguish, but present challenges to machine vision systems in the presence of lower sample density, noisy images, and/or degraded symbols.

While much effort has been spent to provide a superior OCR capability, users should be cautioned that OCR decoders are more susceptible to misreads and noreads than their bar code counterparts. Consequently, The OCR decoder reads OCR only when it is provided with templates detailing the

specifics of the text to read. This allows the software to distinguish the text of interest from random text that may be present in the same image. In addition, the OCR decoder supports a checksum capability to reduce the probability of misreads.

Multiple templates may be active at the same time for more user flexibility.

12.2 OCR Overview

The following OCR characters are currently supported:

OCR-A:

ABCDEFGHIJKLMNOPQRSTUVWXYZ
0123456789
#&() *+-. /<>@ \€¥

OCR-B:

ABCDEFGHIJKLMNOPQRSTUVWXYZ
0123456789
#\$&() *+-. /<>@ \€¥

The templates define the OCR font as well as the layout of the text in a row, column format. Each row can have up to 50 chars, with up to 18 rows in a template. However, the total number of characters can not exceed 320 characters. Within each character position, the allowable characters can be specified either through explicit ASCII values, groups of ASCII values, wildcard characters, or combinations of these types. To achieve better OCR results, it is desirable to limit the values that a character position can take to the known values that will occur in an application.

The OCR decoder can also handle spaces within OCR text with some restrictions. Internal gaps longer than one space are not allowed in templates. For example, the OCR-A text

ONE SPACE

is valid because there is only one space between the E and S in the text. However, the following text is illegal given the two spaces between the O and S:

TWO SPACES

The OCR decoder can handle arbitrary number of spaces at the beginning and end of a line. These spaces must be explicitly included in the template with the ASCII value of a space (32) and not be included as part of a group or wildcard character.

The OCR decoder also provides a checksum capability to reduce the probability of misreads. There are two types of checksums provided: row and block. A row checksum provides a checksum for all

characters from the checksum to the first character of a single row in a template. A block checksum provides a checksum from its character position all the way to the first character of the overall template. For additional checksum protection, four different weighting schemes are supported: 1, 12, 13, and 137. Finally, the checksum calculation is based on modulo arithmetic. The modulo factor may vary from 6 to 36.

The OCR decoder is designed to read OCR text that is within a certain sampled range in pixels. The ideal height of an OCR character after sampling is about 20 pixels. The OCR decoder will read characters that are up to 50 pixels in height. If OCR characters are consistently above 40 pixels in height, down sampling the image by a factor of 2 before submitting it to OCR decoder will achieve better results in both speed and decode rates.

12.3 OCR Output String Values

There is no 7 bit ASCII representation for the Euro, Pound, or Yen currency characters. The 8 bit values that are returned in the result string for these characters are based on the typical code page values used in Windows. The 8 bit codes used are as follows:

Character Value

- € - Euro 128
- £ - Pound 163
- ¥ - Yen 165

12.4 OCR User Templates

User Templates are NULL terminated strings made up of various control codes along with standard ASCII values. The control codes are assigned to ASCII values below the value of 32. The currently defined control codes are:

Control Code Definition	Value	Argument
End of Template	0	
New Template	1	Font [1-3]
New Line	2	
Define Group Start	3	ID [1-255]
Define Group End	4	
Wildcard: Numeric (0-9)	5	
Wildcard: Alpha (A-Z)	6	
Wildcard: Alphanumeric	7	
Wildcard: Any (including space)	8	
Defined Group	10	ID [1-255]
In Line Group Start	11	
In Line Group End	12	
Checksum	13	Weights, Type, MOD

12.4.1 End of Template (0)

All templates end with the *End of Template* control code.

12.4.2 New Template (1)

A user template may contain multiple distinct templates all within the same string. These distinct templates all begin with the *New Template* control code. The value immediately following this control code indicates the font(s) for which this template is designed. The current valid font values are

Font Value Active Fonts:

- 1 0CR-A
- 2 0CR-B
- 3 0CR-A and 0CR-B

As an example, the following byte sequence reads 8 alphanumeric digits in either OCR-A or OCR-B and is the default user template:

1,3,7,7,7,7,7,7,0

12.4.3 New Line (2)

The OCR decoder supports multiline templates. A new line within a multiline template is indicated by the *New Line* control code.

12.4.4 Define Group Start (3)

In a given character position, the user specifies which values a text character may take. To reduce the overall size of templates, users may define common groups of ASCII characters and then use the defined group rather than repeating the same sequence over and over. Groups can be made up of individual ASCII values or wildcard values. The wildcard values are control codes *Numeric* (5), *Alpha* (6), *Alphanumeric* (7), and *Any*(8). Groups may **not** be nested.

To define a group, specify the *Group Start* control code followed by a single byte *ID* value that may range from 1 to 255. Up to 255 groups may be defined in a single template. Once a group is defined, you may not define another group with the same group *ID*. Following its definition, a group may be used in any subsequent individual template.

For example, say we want to read an 8 character OCR-B text where each character may be a hexadecimal digit (0123456789ABCDEF). We can define a group that would begin the definition with the *Group Start* control code (3), followed by its ID (1), followed by the *Numeric* wildcard (5), followed by the ASCII values of the six desired letters. Finally all group definitions are terminated with the *Group End* control code (4):

1,2,3,1,5,65,66,67,68,69,70,4,10,1,10,1,10,1,10,1,10,1,10,1,10,1,10,1,0

The sequence of numbers of 65 through 70 are the decimal ASCII values for the upper case letters A through F. To use the defined group, we use the **Defined Group** (10) control code followed by the group ID. Each sequence of 10,1 above occupies a single character position in the OCR text to be read. The remainder of the example above include the **Template Start** (1) control code at the beginning followed by the OCR-B font designator (2). Finally, the template is ended with the **End of Template** (0) control code.

12.4.5 Define Group End (4)

The **Define Group End** control code is used to terminate a **Defined Group**. A **Define Group End** must always be preceded by a **Define Group Start** and conversely, a **Define Group Start** must always be followed by a **Define Group End**.

12.4.6 Wildcard: Numeric (5)

The **Numeric Wildcard** control code may be used anywhere a single ASCII character code may be used and indicates that the current text character can be any of the 10 numeric digits.

12.4.7 Wildcard: Alpha (6)

The **Alpha Wildcard** control code may be used anywhere a single ASCII character code may be used and indicates that the current text character can be any of the 26 upper case alphabetic letters.

12.4.8 Wildcard: Alphanumeric (7)

The **Alphanumeric Wildcard** control code may be used anywhere a single ASCII character code may be used and indicates that the current text character can be any of the 26 upper case alphabetic letters or any of the 10 numeric digits.

12.4.9 Wildcard: Any (8)

The **Any Wildcard** control code may be used anywhere a single ASCII character code may be used and indicates that the current text character can be any valid character that the designated font for this template supports. For OCR-A and OCR-B this includes the 26 upper case letters, the 10 numeric digits, and the 16 punctuation characters. It includes the space character as well.

12.4.10 Defined Group (10)

The **Defined Group** control code uses a previously defined group. The byte immediately following the **Defined Group** control code must match a previously defined group. This group occupies one character position in the template.

12.4.11 In Line Group Start (11)

The **In Line Group Start** defines a one time instance of a group that occupies one character position in the template. Use this control code for unique groups of characters that occur only once. One could use a **Define Group Start** control code instead. The inclusion of both types is done for the convenience of the user.

The *In Line Group* must always be ended with an *In Line Group End* control code.

12.4.12 In Line Group End (12)

The *In Line Group End* control code is used to terminate an active *In Line Group* definition.

12.4.13 Checksum (13)

Checksums may be used to reduce the probability of misreads involving OCR. The OCR decoder supports a number of options associated with checksums. The user may specify the type (block or row), the weight scheme (1, 12, 13, 137) and the modulo value of the checksum (6-36). The byte immediately following the *Checksum* control code defines the type of checksum that will be used:

Bit Position(s)	Meaning
7,6: Weight Scheme	00: Weight Scheme: 1
	01: Weight Scheme: 12
	10: Weight Scheme: 13
	11: Weight Scheme: 137
5: Checksum Type	0: Row
	1: Block
4-0: Modulo Value	Checksum Modulo - 5

Row Checksums perform a checksum calculation on all characters preceding them up to the first char on the same row. Block Checksums perform a checksum calculation on all characters up to the very first character in the template; they span multiple rows.

The 5 bit Modulo Value stores the *Checksum Modulo* - 5. The stored number may range from 1, which is a *Checksum Modulo* value of 6, to 31, which describes a *Checksum Modulo* of 36. A Modulo value of 0 (*Checksum Modulo* of 5) is illegal.

The characters within a checksum field have a numerical value that is used in the checksum calculation.

Digits are converted to their numerical value (0-9), while Upper case letters range from 10 for an 'A' up to 36 for a 'Z'. All punctuation characters currently have a value of 0 for checksum purposes. However, they do count as a spot for determining the weight values that will be used in calculating the checksum.

The *Weight Scheme* defines how the values described above can be changed based on their character position. The default weight scheme is 1. This means that the checksum is based only on the character value and is not dependent on its position. The other weight schemes multiply the character value by a repetitive weight value that helps in identifying characters that have had their column locations switched. The 4 weight schemes are:

Weight Scheme Multiplier values

1	1,1,1,1,1,....
12	1,2,1,2,1,2,....

13	1,3,1,3,1,3,....
137	1,3,7,1,3,7,1,3,7,....

The checksum character itself always start with a weight of 1. As we move away from the checksum towards the left, we update the weight value to the next member of the sequence. The sequences repeat over and over until the first character in a row for a **Row** type checksum, and to the first character in the template for a **Block** type checksum. The resulting sum is then divided by the **Checksum Modulo** number of the checksum and the remainder of this division should be zero for a valid checksum.

For example, the following 2 line OCR-B template contains a mod 10 checksum with weight 1 (5) at the end of each line along with a mod 36 block checksum with weight 13 (191) as the last character. There are a total of 8 alphanumeric characters per line including the checksums:

1,2,7,7,7,7,7,7,13,5,2,7,7,7,7,7,13,5,13,191,0

12.4.14 Example OCR User Templates

This section gives some examples of valid OCR User Templates along with the OCR text they are designed to read.

12.4.14.1 Multi_Row with Leading and Trailing Spaces

123456
 ABCDEF G

The OCR-B text above is made up of two lines, the top being purely numeric and the bottom purely alphabetic. Also, the second line is offset from the first by two spaces. The following template will read this text:

1,2,5,5,5,5,5,5,2,32,32,6,6,6,6,6,6,0

Note the 2 following the 6 numeric wild card digits: this indicates that the template is inserting a new line. Also of note are the leading two spaces on the second line. They must be explicitly indicated by using the ASCII value of a space: decimal value 32. You may not use a wildcard or group to indicate leading (or trailing) space. Finally, the trailing spaces on line 1 do not need to be explicitly entered into the template. They are assumed to be there based on the number of character positions defined for the row.

12.4.14.2 Row and Block Checksums

ABCD6
 EFG5X

The two lines of OCR-B alphabetic text above both contain a row checksum. In addition, the last character of row 2 is a block checksum. The 2 row checksums are mod 10 with a 13 weight (control

code 133), while the block checksum is a mod 36 with a 137 weight (control code 255). The following template will read this text:

1,2,6,6,6,6,13,133,2,6,6,6,13,133,13,255,0

The top line checksum is the 6 at the end of the line. While this example shows the checksum at the end of the line, it may appear anywhere on the line and then protects all the characters to its left. The following sum is generated to verify a proper checksum on line 1:

$$\begin{array}{l} \text{'6' 'D' 'C' 'B' 'A'} \\ (1 \times 6) + (3 \times 13) + (1 \times 12) + (3 \times 11) + (1 \times 10) = 100 \end{array}$$

Note the 13 weight scheme starting with a 1 on the checksum digit, and then alternating between a 1 and 3 for all digits to the left of the checksum up to the first character on the line. The numerical values of the alphabetic characters range from 10 for an 'A' up to a 36 for a 'Z'. The sum of 100 is a multiple of 10, so the mod 10 checksum here has passed.

On line 2, the row checksum is the 5 following the G. Verifying its line by generating its sum:

$$\begin{array}{l} \text{'5' 'G' 'F' 'E'} \\ (1 \times 5) + (3 \times 16) + (1 \times 15) + (3 \times 14) = 110 \end{array}$$

Again, we have obtained a value that is a multiple of 10, validating this row checksum.

The X at the end of the line is a mod 36 block checksum with 137 weighting. It protects all the characters in the template, including the first line. Calculating its sum working backwards from the block checksum and using the 137 weighting scheme:

$$\begin{array}{l} \text{'X' '5' 'G' 'F' 'E' '6' 'D' 'C' 'B' 'A'} \\ (1 \times 34) + (3 \times 5) + (7 \times 16) + (1 \times 15) + (3 \times 14) + (7 \times 6) + (1 \times 13) + (3 \times 12) + (7 \times 11) + (1 \times 10) = 396 \end{array}$$

The resulting sum is a multiple of 36, so the block checksum has been validated.

12.4.14.3 Multiple Individual Templates

A single template may contain multiple individual templates. For example consider the following two distinct OCR text strings that are to be read with the same template:

A1234 B5678

The first string is in OCR-A font while the second is OCR-B. Assume that the 'A' and 'B' are always present as the first character of the two strings and that the 4 numeric characters may be any digits. A user may code these up as two distinct templates with the following:

1,1,65,5,5,5,5,1,2,66,5,5,5,5,0

OCR decoder supports either format. Also, according to the ISBN specification, the hyphens in the ISBN string may be replaced by spaces. The OCR decoder supports this format as well.

There is a new ISBN format that will be in effect as of January 1, 2007. It adds an additional 4 characters to the original ISBN number:

ISBN 978-0-571-08989-5

The ISBN template supports this format along with the original. All the comments associated with the original ISBN format discussed above apply here as well. The one exception is the checksum is now a Mod 10 checksum and as a result, the checksum can now only be in the range from 0 – 9 and does not take the value 'X' anymore.

12.5.3 Price Field Internal Template

The Price Field is used in a number of applications including book pricing. The format of the field is as follows:

C1234 P5678E

The field begins with a 'C' and ends with an 'E'. The first part of the Price Field is a 'C' followed by four numeric digits. The second half begins with a currency character. The above example shows the letter 'P' but the Price Field template allows the following additional characters:

\$€¥

Following the currency character, a numeric grouping of 3, 4, 5 or 6 digits is followed by a terminating letter 'E'. The template supports both OCR-A and OCR-B fonts.

The following examples will also be recognized by the OCR decoder Price Field internal template:

C6712 \$801E
C0217 €4399E
C0823 ¥31559E
C0331 £706213E
